

Verified work. Trusted proof. Stablecoin rewards.

ScoutPay connects organizations that need real-world facts with local contributors who can verify them quickly.

7
seeded tasks

5
verification categories

4
proof signals

USDC
escrow & payouts

The product thesis

Turn field verification into a transparent, crypto-native work network: sponsors fund tasks, contributors submit location-aware proof, AI assists review, and approved work releases stablecoin rewards.

The verification gap — and how ScoutPay closes it

PROBLEM

01 Slow and fragmented

Organizations coordinate field checks through calls, spreadsheets and disconnected contractors.

02 Trust is expensive

Photos alone do not establish location, timing, uniqueness or reviewer confidence.

03 Payouts create friction

Cross-border micro-rewards are costly, delayed and difficult to audit.

SOLUTION

- 1 **Sponsor escrows a reward**
- 2 **Worker completes a nearby task**
- 3 **GPS, photo, time and note become proof**
- 4 **AI surfaces quality and fraud signals**
- 5 **Reviewer approves or rejects**
- 6 **USDC is released; reputation updates**

Why now

DePIN networks, digital public infrastructure and stablecoin settlement make high-frequency field verification practical.

One accountable path from task to payout

Contributor experience

Map and list discovery, category filters, escrow status, guided proof capture, AI feedback and submission history.

Reviewer experience

Proof score, location match, image relevance, duplicate check and fraud risk are visible before approval.

Built for both sides of the network

CONTRIBUTORS

Task marketplace

Nearby work, urgency, deadlines and rewards.

Proof capture

Photo, GPS, timestamp, note and sensor results.

Wallet & earnings

Mock wallet, USDC balance and payout history.

Reputation

Trust score, approval rate and role badges.

SPONSORS & REVIEWERS

Campaign builder

Category, location, reward, count and proof rules.

Escrow visibility

Budget preview and locked-reward status.

AI-assisted review

Quality indicators make decisions faster.

Audit trail

Proof hashes and transaction-style references.

Demo-ready by design

The full journey can be demonstrated without external accounts or blockchain setup; every simulated element is clearly labelled.

A focused MVP architecture

EXPERIENCE

Mobile-first responsive web app

Dashboard · Tasks · Submit · Review · Sponsor · Reputation

STATE

Browser-persisted demo data

React context and local storage preserve the guided flow

INTELLIGENCE

Deterministic AI simulation

Repeatable proof scores across location, image, duplicate and risk

SETTLEMENT

Mock crypto rails

Wallet address, escrow, payout and proof hashes are simulated

Production evolution

Replace local state with authenticated storage; connect Solana or EVM wallets; deploy smart-contract escrow; store media securely; add geofencing, device attestation and reviewer governance.

A crisp three-minute story

- 1 Connect the mock wallet
- 2 Open “Verify EV charger status”
- 3 Start the task and capture proof
- 4 Run AI validation
- 5 Approve in the review queue
- 6 Watch USDC and reputation increase

NEXT MILESTONES

01 Persistent accounts & campaigns

02 Real wallet connection

03 On-chain escrow and payout

04 Production proof storage

05 Pilot with one verification vertical

ScoutPay

Real-world verification becomes accountable work.

Sponsors gain faster field intelligence. Contributors gain transparent access to stablecoin rewards.
